Virtualization support

Axway provides support for Axway products running in a virtual environment in an identical manner as with Axway products running on any other major x86-based system without initially requiring the reproduction of issues on native hardware. If, however, Axway suspects that the virtualization layer is the root cause of an incident, then the customer is required to contact the appropriate virtualization support provider to resolve the virtualization issue.

While Axway products are expected to function properly in a virtual environment, there may be performance implications which can invalidate Axway's typical sizing and recommendations.

Refer to the product documentation to know if a specific virtualization feature is supported.

Supported Databases

This section lists the supported databases required by Axway products that have a database prerequisite.
